Introducing the 1st multidisciplinary guide to review articles

INDEX TO SCIENTIFIC REVIEWS™

Now you can easily find review articles on any subject in science. Each year the *Index to Scientific Reviews (ISR™)* will index over 16,000 reviews selected from more than 2,700 of the world's most important journals.

Broad Coverage
Over 100 disciplines in every area of science are covered:

Agricultural, Biological & Environmental Sciences
Engineering, Technology & Applied Sciences
Medical & Life Sciences
Physical & Chemical Sciences
Social & Behavioral Sciences

So you won't have to go through separate references to locate review articles for subjects in any of these areas. With one index—the *ISR*—you can cross disciplinary lines and retrieve these key articles no matter where they were published in the literature. The *ISR* will even cover the literature published in quarterly and annual "review" publications (e.g., *Annual Review of Genetics).*

Effectively Indexed
The *Index to Scientific Reviews* makes it easy to find the review articles you need. Search by authors, title words and phrases, and organizations. Or use the *ISR*'s citation index—it lets you start a search with previously published material relevant to a subject and find more recent articles through citation relationships.

Highly Current
The *ISR* indexes the review literature on a calendar year basis. A soft-bound semiannual issue (covering January to June) will be available each September, and a hard-bound annual cumulation will appear the following April. So you can find new articles while they're still new.

What's It To You?
The *ISR* is a quick and easy way to find: 1) summaries of knowledge in fields unfamiliar to you, 2) those key articles you need to start a really thorough literature search, 3) the most recent review articles on any subject in science.

For More Information . . .
The first *ISR* annual cumulation (covering the 1974 literature) will soon be out, so get the full story on the *Index to Scientific Reviews* now. Just fill in the coupon, and mail it today. ©1974 ISI

I'd like to know more about the *Index to Scientific Reviews*™.

Volume III, Part 2

Muscle Receptors

By D. Barker, C. C. Hunt, A. K. McIntyre

Edited by Professor **C. C. Hunt,** Dept. of Physiology and Biophysics, Washington University, School of Medicine, St. Louis, Mo., USA

With 128 figures. VIII, 310 pages. 1974
Cloth DM 130,–; US $53.30
Subscription price* Cloth DM 104,–; US $42.70
ISBN 3-540-06891-0
Prices are subject to change without notice

Muscle sense organs are considered from the standpoint of their structure and functional characteristics and the sensory role they subserve in central nervous system function. Emphasizing vertebrate muscle receptors in amphibia, reptiles, birds, and mammals, the structure and function of the muscle spindle is discussed in detail. The efferent control of this sense organ is considered with respect to the morphology of the intrafusal muscle fibers and their motor innervation and the mechanisms by which the sensory responses are modulated. Thus, this work combines an authoritative review of muscle-receptor morphology with consideration of the behavior of receptors and their sensory role in the central nervous system.

Volume III, Part 3

Electroreceptors and Other Specialized Receptors in Lower Vertebrates

By T. H. Bullock, A. Fessard, P. H. Hartline, Ad. J. Kalmijn, P. Laurent, R. W. Murray, H. Scheich, E. Schwartz, T. Szabo

Edited by Professor Dr. **A. Fessard,** Collège de France, Station de l'Institut Marey, Paris/France

With 118 figures. VIII, 333 pages. 1974
Cloth DM 130,–; US $53.30
Subscription price* Cloth DM 104,–; US $42.70
ISBN 3-540-06872-4
Prices are subject to change without notice

This volume offers a comprehensive treatment of some highly specialized sense organs in fish, amphibians, and snakes. For the electroreceptors in fish, with and without electric organs, the morphology, ultrastructure and encoding modalities are covered, as well as their role in behavior and social communication. The morphology of the lateral-line organ in fish and amphibians is described in connection with its directional sensitivity under the control of an efferent innervation. For the infrared-sensitive pit organs of some snakes, the morphology and electrophysiology are explained in addition to their role in behavior. Also included are the receptors in the pseudobranchial system of some teleostean fish, which respond to variations in hydrostatic and osmotic pressure and to changes in the concentration of ions and respiratory gases. Each chapter integrates methods with results and is written by a specialist for the particular area of research.
